**Case Description:** Completed / Regular / X-ray / General read

**Case History:**

Please Evaluate hips and elbows for breeding purposes

**Case Report:**

591102 KW/bs

Three digitalized radiographic images containing projections of the pelvis and elbows were submitted for evaluation. The radiographic request is dated 3/13/23.

**Radiographic Findings:**

Both femoral heads are located in their respective acetabula with greater than 50% of the femoral heads located medial to the dorsal acetabular rims.

Both femoral heads are congruous with the acetabula with slight widening of the medial aspect of the coxofemoral joints.

No osteophyte formation is present on the femoral necks or acetabula.

Alignment of the patellae with the femurs is normal.

Muscle volume in both hind legs is within normal limits.

The anconeal process of both ulnae and proximocranial aspect of both radii are smooth with no evidence of osteophyte formation.

No sclerosis is associated with the ulnar notches.

Both medial coronoid processes are smooth in contour and a fragment associated with the medial coronoid processes is not identified.

**Diagnosis:** Normal pelvis and elbows.

**Comments:** Radiographic changes to suggest elbow or hip dysplasia are not present. Based on the OFA scheme of evaluating hips, the hips would be rated as good in conformation. Radiographs obtained at 2 year of age will need to be evaluated to completely exclude elbow and hip dysplasia and to establish a final rating on the coxofemoral joints.
