Owner: Lisa Herbst
Practitioner: Dr. Randy VanMaanen

Patient: Magnolia
Species/Breed: Dog / Bernedoodle
Age/Gender: 1 Year(s) / female
Submitted Date: 01/11/2021 06:32:13 PM
Completed Date: 01/13/2021 10:39:04 AM

Case Status/Priority: Completed / Regular

Case History:

Sending radiographs for Magnolia of hips and elbows

Case Report:

514717 KW/bs

Three digitalized radiographic images containing projections of the pelvis and elbows were submitted for evaluation. The radiographic request is dated 1/11/21.

Radiographic Findings:

Both femoral heads are well seated in their respective acetabula with greater than 50% of the femoral heads located medial to the dorsal acetabular rims.

Both femoral heads are congruous with the acetabula; however, there is slight widening of the medial aspect of the left coxofemoral joint.

No osteophyte formation is present on the femoral necks or acetabula.

Alignment of the patellae with the femurs is normal.

Muscle volume in both hind legs is within normal limits.

The anconeal process of both ulnae and proximocranial aspect of both radii are smooth with no evidence of osteophyte formation.

No sclerosis is associated with the ulnar notches.

Both medial coronoid processes are smooth in contour and a fragment associated with the medial coronoid processes is not identified.

Diagnosis: Normal pelvis and elbows.

Comments: Radiographic changes to suggest elbow or hip dysplasia are not present. Based on the OFA scheme of evaluating hips, the hips would be rated as good in conformation. Radiographs obtained at 2 years of age will need to be evaluated to completely exclude elbow and hip dysplasia and to establish a final rating on the coxofemoral joints.
